

At last – an alternative to covering up expensive wallpaper with electrical switches and sockets!

Our new Crystal Range of transparent switch plates comes from a simple, but ingenious idea -the cover plates are made of hard-wearing scratch-resistant acrylic, which means they're virtually invisible once installed. The result? Wall coverings are protected, but not obscured.

The range is also designed with the decorator in mind: the adjustable fixing grids are mounted within the back box or aperture, so switches can be wired and connected without fixing the cover plate. This can be left until all the decorating work is complete.

What about low level accessories – sockets, telecom and TV outlets etc.? To compliment the 'invisible' style of the Crystal switch plate, we can offer a range of plates with a Yellow etched primer paint where the plates are to be professionally finished elsewhere to match the interior décor. Yellow etched primed plates are available to special order and quotation.
