

Water Macerators

Water Bunny macerators dispose of sanitary towels, paper towels and similar waste products of small cotton wool or wadding construction by grinding them into minute particles which are flushed into the waste drains by water. Each machine caters for establishments with up to 250 staff. Fed by mains water, or a storage tank, they are actuated by lifting the access flap and inserting the towel. A 90 second cycle commences on closing the flap which starts the water flow and the grinding action. Disposal is usually effected in 25 seconds, the remaining time is for cleaning down the machine.

Opening the flap during a cycle automatically stops the machine and on closing again a new cycle commences to ensure complete maceration. The machine stops if the access flap is opened or the cover removed and a thermal overload safeguards against the rare occurrence of overloading.

Water Bunny 500

Water Bunny 500

A compact wall mounted unit with white epoxy polyester powder coated steel cabinet and strong glass reinforced plastic top. Access to the integral parts of the machine is gained by removing the front panel which is secured by a cylinder lock.

Water Bunny 701

This model has all the technical features of the Water Bunny 500 with the added facility of flush mounting. Front panels are fixed by vandal resistant, yet quickly released, fasteners. All the mechanical parts are housed integrally.

All Wandsworth waste disposers offer an efficient and safe way of disposing of sanitary towels.

Brushed stainless steel front cover.
